REC_Python_Week 6_MCQ

Attempt : 1
Total Mark : 20
Marks Obtained : 19

Section 1 : MCQ

1. What happens if an exception is not caught in the except clause?

Answer

The program will display a traceback error and stop execution

Status : Correct

Marks : 1/1

2. What is the purpose of the except clause in Python?

Answer

To handle exceptions during code execution

Status : Correct

Marks : 1/1

3. What is the difference between r+ and w+ modes?

Answer

in r+ the pointer is initially placed at the beginning of the file and the pointer is at the end for w+

Status : Correct

Marks : 1/1

4. Fill in the code in order to get the following output:

Output:

Name of the file: ex.txt

```
fo = open(_____(1), "wb")  
print("Name of the file: ",_____(2))
```

Answer

1) "ex.txt" 2) fo.name

Status : Correct

Marks : 1/1

5. Fill in the blanks in the following code of writing data in binary files.

```
import _____ (1)  
rec=[]  
while True:  
    rn=int(input("Enter"))  
    nm=input("Enter")  
    temp=[rn, nm]  
    rec.append(temp)  
    ch=input("Enter choice (y/N)")  
    if ch.upper=="N":  
        break  
f.open("stud.dat", "_____(2)")  
_____.dump(rec,f)(3)  
_____.close()(4)
```

Answer

(pickle,wb,pickle,f)

Status : Correct

Marks : 1/1

6. Which of the following is true about the finally block in Python?

Answer

The finally block is always executed, regardless of whether an exception occurs or not

Status : Correct

Marks : 1/1

7. What is the output of the following code?

```
class MyError(Exception):  
    pass
```

```
try:  
    raise MyError("Something went wrong")  
except MyError as e:  
    print(e)
```

Answer

Something went wrong

Status : Correct

Marks : 1/1

8. What is the output of the following code?

```
try:  
    x = "hello" + 5  
except TypeError:  
    print("Type Error occurred")  
finally:  
    print("This will always execute")
```

Answer

Type Error occurred This will always execute

Status : Correct

Marks : 1/1

9. What is the correct way to raise an exception in Python?

Answer

raise Exception()

Status : Correct

Marks : 1/1

10. Which of the following is true about
fp.seek(10,1)

Answer

Move file pointer ten characters ahead from the current position

Status : Correct

Marks : 1/1

11. How do you create a user-defined exception in Python?

Answer

By creating a new class that inherits from the Exception class

Status : Correct

Marks : 1/1

12. What will be the output of the following Python code?

Predefined lines to simulate the file content

```
lines = [  
    "This is 1st line",  
    "This is 2nd line",  
    "This is 3rd line",  
    "This is 4th line",  
    "This is 5th line"  
]
```

```
print("Name of the file: foo.txt")
```

```
# Print the first 5 lines from the predefined list
for index in range(5):
    line = lines[index]
    print("Line No %d - %s" % (index + 1, line.strip()))
```

Answer

Displays Output

Status : Correct

Marks : 1/1

13. What is the output of the following code?

```
try:
    x = 1 / 0
except ZeroDivisionError:
    print("Caught division by zero error")
finally:
    print("Executed")
```

Answer

Caught division by zero errorExecuted

Status : Correct

Marks : 1/1

14. What is the default value of reference_point in the following code?

```
file_object.seek(offset [,reference_point])
```

Answer

0

Status : Correct

Marks : 1/1

15. What will be the output of the following Python code?

```
f = None
```

```
for i in range (5):  
    with open("data.txt", "w") as f:  
        if i > 2:  
            break  
print(f.closed)
```

Answer

True

Status : Correct

Marks : 1/1

16. What happens if no arguments are passed to the seek function?

Answer

file position is set to the end of file

Status : Wrong

Marks : 0/1

17. How do you rename a file?

Answer

os.rename(existing_name, new_name)

Status : Correct

Marks : 1/1

18. Which clause is used to clean up resources, such as closing files in Python?

Answer

finally

Status : Correct

Marks : 1/1

19. Fill the code to in order to read file from the current position.

Assuming exp.txt file has following 3 lines, consider current file position is beginning of 2nd line

Meri,25

John,21

Raj,20

Ouput:

['John,21\n','Raj,20\n']

```
f = open("exp.txt", "w+")
```

```
_____ (1)
```

```
print _____ (2)
```

Answer

1) f.seek(0, 1) 2) f.readlines()

Status : Correct

Marks : 1/1

20. Match the following:

a) f.seek(5,1) i) Move file pointer five characters behind from the current position

b) f.seek(-5,1) ii) Move file pointer to the end of a file

c) f.seek(0,2) iii) Move file pointer five characters ahead from the current position

d) f.seek(0) iv) Move file pointer to the beginning of a file

Answer

a-iii, b-i, c-ii, d-iv

Status : Correct

Marks : 1/1

REC_Python_Week 6_COD

Attempt : 1
Total Mark : 50
Marks Obtained : 50

Section 1 : Coding

1. Problem Statement

Sophie enjoys playing with words and wants to count the number of words in a sentence. She inputs a sentence, saves it to a file, and then reads it from the file to count the words.

Write a program to determine the number of words in the input sentence.

File Name: sentence_file.txt

Input Format

The input consists of a single line of text containing words separated by spaces.

Output Format

The output displays the count of words in the sentence.

Refer to the sample output for the formatting specifications.

Sample Test Case

Input: Four Words In This Sentence

Output: 5

Answer

```
n=input()
f=open("sentence_file.txt","w+")
f.write(n)
f.seek(0)
n1=f.read()
f.close()
```

```
i=0
j=0
if n1.strip()=="":
    print("0")
else:
    for i in range(len(n1)):
        if n1[i]==" ":
            j+=1
    print(j+1)
```

Status : Correct

Marks : 10/10

2. Problem Statement

A retail store requires a program to calculate the total cost of purchasing a product based on its price and quantity. The program performs validation to ensure valid inputs and handles specific error conditions using exceptions:

Price Validation: If the price is zero or less, raise a ValueError with the message: "Invalid Price". Quantity Validation: If the quantity is zero or less, raise a ValueError with the message: "Invalid Quantity". Cost Threshold: If

the total cost exceeds 1000, raise RuntimeError with the message: "Excessive Cost".

Input Format

The first line of input consists of a double value, representing the price of a product.

The second line consists of an integer, representing the quantity of the product.

Output Format

If the calculation is successful, print the total cost rounded to one decimal place.

If the price is zero or less prints "Invalid Price".

If the quantity is zero or less prints "Invalid Quantity".

If the total cost exceeds 1000, prints "Excessive Cost".

Refer to the sample output for formatting specifications.

Sample Test Case

Input: 20.0

5

Output: 100.0

Answer

```
n=float(input())
n1=int(input())
f=""
try:
    if(n<=0):
        f="Invalid Price"
        raise ValueError()
    if(n1<=0):
        f="Invalid Quantity"
        raise ValueError()
    n2=n*n1
    if(n2>1000):
```

```
print("Excessive Cost")
else:
    print(f"{n2:.1f}")
except Exception:
    print(f)
```

Status : Correct

Marks : 10/10

3. Problem Statement

Tara is a content manager who needs to perform case conversions for various pieces of text and save the results in a structured manner.

She requires a program to take a user's input string, save it in a file, and then retrieve and display the string in both upper-case and lower-case versions. Help her achieve this task efficiently.

File Name: text_file.txt

Input Format

The input consists of a single line containing a string provided by the user.

Output Format

The first line displays the original string read from the file in the format: "Original String: {original_string}".

The second line displays the upper-case version of the original string in the format: "Upper-Case String: {upper_case_string}".

The third line displays the lower-case version of the original string in the format: "Lower-Case String: {lower_case_string}".

Refer to the sample output for the formatting specifications.

Sample Test Case

Input: #SpecialSymBoLs1234

Output: Original String: #SpecialSymBoLs1234
Upper-Case String: #SPECIALSYMBOLS1234
Lower-Case String: #specialsymbols1234

Answer

```
n=input()
f=open("text_file.txt","w+")
f.write(n)
f.seek(0)
n1=f.read()
f.close()
print("Original String: ",n1)
print("Upper-Case String: ",n1.upper())
print("Lower-Case String: ",n1.lower())
```

Status : Correct

Marks : 10/10

4. Problem Statement

Write a program that calculates the average of a list of integers. The program prompts the user to enter the length of the list (n) and each element of the list. It performs error handling to ensure that the length of the list is a non-negative integer and that each input element is a numeric value.

Input Format

The first line of the input is an integer n, representing the length of the list as a positive integer.

The second line of the input consists of an element of the list as an integer, separated by a new line.

Output Format

If the length of the list is not a positive integer or zero, the output displays "Error: The length of the list must be a non-negative integer."

If a non-numeric value is entered for the length of the list, the output displays "Error: You must enter a numeric value."

If a non-numeric value is entered for a list element, the output displays "Error:

You must enter a numeric value."

If the inputs are valid, the program calculates and prints the average of the provided list of integers with two decimal places: "The average is: [average]".

Refer to the sample output for the formatting specifications.

Sample Test Case

Input: -2

1
2

Output: Error: The length of the list must be a non-negative integer.

Answer

```
class ZerroError(Exception):
    pass

try:
    n_str = input()
    try:
        n = int(n_str)
    except:
        raise Exception()

    if n <= 0:
        raise ZerroError()

    avg = 0
    for _ in range(n):
        val = input()
        if not val.isnumeric():
            raise Exception()
        avg += int(val)

    avg /= n
    print(f"The average is: {avg:.2f}")
```

```
except ZeroError:
    print("Error: The length of the list must be a non-negative integer.")
except Exception:
    print("Error: You must enter a numeric value.")
```

Status : Correct

Marks : 10/10

5. Problem Statement

In a voting system, a person must be at least 18 years old to be eligible to vote. If a user enters an age below 18, the system should raise a user-defined exception indicating that they are not eligible to vote.

Input Format

The input contains a positive integer representing age.

Output Format

If the age is less than 18, the output displays "Not eligible to vote".

Otherwise, the output displays "Eligible to vote".

Refer to the sample output for formatting specifications.

Sample Test Case

Input: 18

Output: Eligible to vote

Answer

```
try:
    n=int(input())
    if(n<18):
        f="Not eligible to vote"
        raise Exception()
    print("Eligible to vote")
except Exception:
    print(f)
```

Status : Correct

Marks Obtained : 30

Section 1 : Coding

1. Problem Statement

Peter manages a student database and needs a program to add students. For each student, Alex inputs their ID and name. The program checks for duplicate IDs and ensures the database isn't full.

If a duplicate or a full database is detected, an appropriate error message is displayed. Otherwise, the student is added, and a confirmation message is shown. The database has a maximum capacity of 30 students, and each student must have a unique ID.

Input Format

The first line contains an integer n, representing the number of students to be added to the school database.

The next n lines each contain two space-separated values, representing the student's ID (integer) and the student's name (string).

Output Format

The output will depend on the actions performed in the code.

If a student is added to the database, the output will display: "Student with ID [ID number] added to the database."

If there is an exception due to a duplicate student ID, the output will display: "Exception caught. Error: Student ID already exists."

If there is an exception due to the database being full, the output will display: "Exception caught. Error: Student database is full."

Refer to the sample outputs for the formatting specifications.

Sample Test Case

Input: 3

16 Sam

87 Sabari

43 Dani

Output: Student with ID 16 added to the database.

Student with ID 87 added to the database.

Student with ID 43 added to the database.

Answer

```
l1=[]
```

```
n=int(input())
```

```
for i in range(n):
```

```
    n3=input().split()
```

```
    n2=int(n3[0])
```

```
    n1=n3[1]
```

```
    if(len(l1)>=30):
```

```
        print("Exception caught. Error: Student database is full.")
```

```
        break
```

```
elif n2 in l1:
    print("Exception caught. Error: Student ID already exists.")
    break
else:
    l1.append(n2)
    print(f"Student with ID {n2} added to the database.")
```

Status : Correct

Marks : 10/10

2. Problem Statement

Reeta is playing with numbers. Reeta wants to have a file containing a list of numbers, and she needs to find the average of those numbers. Write a program to read the numbers from the file, calculate the average, and display it.

File Name: user_input.txt

Input Format

The input file will contain a single line of space-separated numbers (as a string).

These numbers may be integers or decimals.

Output Format

If all inputs are valid numbers, the output should print: "Average of the numbers is: X.XX" (where X.XX is the computed average rounded to two decimal places)

If the input contains invalid data, print: "Invalid data in the input."

Refer to the sample output for format specifications.

Sample Test Case

Input: 1 2 3 4 5

Output: Average of the numbers is: 3.00

Answer

```
try:
    n1=list(map(float,input().split()))
    n2=sum(n1)/len(n1)
    print(f"Average of the numbers is: {n2:.2f}")
except Exception:
    print("Invalid data in the input.")
```

Status : Correct

Marks : 10/10

3. Problem Statement

John is a data analyst who often works with text files. He needs a program that can analyze the contents of a text file and count the number of times a specific character appears in the file.

John wants a simple program that allows him to specify a file and a character to count within that file.

Input Format

The first line of input consists of the file's name to be analyzed.

The second line of the input consists of the string they want to write within the file.

The third line of the input consists of a character to count within the file.

Output Format

If the character is found, the output displays "The character 'X' appears {Y} times in the file." where X is the character and Y is the count,

If the character does not appear in the file, the output displays "Character not found."

Refer to the sample output for the formatting specifications.

Sample Test Case

Input: test.txt

This is a test file to check the character count.

e

Output: The character 'e' appears 5 times in the file.

Answer

```
file_n=input()
f=open(file_n,"w+")
text=input()
text=text.lower()
ch=input()
ch=ch.lower()
f.write(text)
f.seek(0)
n=f.read()
n=list(n)
m=n.count(ch)
if(m==0):
    print("Character not found in the file.")
else:
    print(f"The character '{ch}' appears {m} times in the file.")
```

Section 1 : Coding

1. Problem Statement

A shopkeeper is recording the daily sales of an item for N days, where the price of the item remains the same for all days. Write a program to calculate the total sales for each day and save them in a file named sales.txt that can store the data for a maximum of 30 days. Then, read the file and display the total earnings for each day.

Note: Total Earnings for each day = Number of Items sold in that day × Price of the item.

Input Format

The first line of input consists of an integer N, representing the number of days.

The second line of input consists of N space-separated integers representing the

number of items sold each day.

The third line of input consists of an integer M, representing the price of the item that is common for all N days.

Output Format

If the number of days entered exceeds 30 ($N > 30$), the output prints "Exceeding limit!" and terminates.

Otherwise, the code reads the contents of the file and displays the total earnings for each day on separate lines.

Contents of the file: The total earnings for N days, with each day's earnings appearing on a separate line.

Refer to the sample output for the formatting specifications.

Sample Test Case

Input: 4
5 10 5 0
20
Output: 100
200
100
0

Answer

```
try:
    n=int(input())
    if(n>30):
        raise IndexError()
    list1=list(map(int,input().split()))
    n2=int(input())
    list2=[n2*x for x in list1]
    for i in list2:
        print(i)
```

```
except IndexError:  
    print("Exceeding Limit !")
```

Status : Correct

Marks : 10/10

2. Problem Statement

Implement a program that checks whether a set of three input values can form the sides of a valid triangle. The program defines a function `is_valid_triangle` that takes three side lengths as arguments and raises a `ValueError` if any side length is not a positive value. It then checks whether the sum of any two sides is greater than the third side to determine the validity of the triangle.

Input Format

The first line of input consists of an integer A, representing side1.

The second line of input consists of an integer B, representing side2.

The third line of input consists of an integer C, representing side3.

Output Format

The output prints either "It's a valid triangle" if the input side lengths form a valid triangle,

or "It's not a valid triangle" if they do not.

If there is a `ValueError`, it should print "ValueError: <error_message>".

Refer to the sample output for the formatting specifications.

Sample Test Case

Input: 3

4

5

Output: It's a valid triangle

Answer

try:

```
a = int(input())  
b = int(input())  
c = int(input())
```

if a <= 0 or b <= 0 or c <= 0:

```
    raise ValueError("Side lengths must be positive")
```

if a + b > c and b + c > a and c + a > b:

```
    print("It's a valid triangle")
```

else:

```
    print("It's not a valid triangle")
```

except ValueError as e:

```
    print("ValueError:", e)
```

Status : Correct

Marks : 10/10

3. Problem Statement

Bob, a data analyst, requires a program to automate the process of analyzing character frequency in a given text. This program should allow the user to input a string, calculate the frequency of each character within the text, save these character frequencies to a file named "char_frequency.txt," and display the results.

Input Format

The input consists of the string.

Output Format

The first line prints "Character Frequencies:".

The following lines print the character frequency in the format: "X: Y" where X is the character and Y is the count.

Refer to the sample output for the formatting specifications.

Sample Test Case

Input: aaabbbccc

Output: Character Frequencies:

a: 3

b: 3

c: 3

Answer

```
text = input()
```

```
freq = {}
```

```
for ch in text:
```

```
    freq[ch] = freq.get(ch, 0) + 1
```

```
with open("char_frequency.txt", "w") as f:
```

```
    f.write("Character Frequencies:\n")
```

```
    for ch, count in freq.items():
```

```
        f.write(f"{ch}: {count}\n")
```

```
print("Character Frequencies:")
```

```
for ch, count in freq.items():
```

```
    print(f"{ch}: {count}")
```

Status : Correct

4. Problem Statement

Alice is developing a program called "Name Sorter" that helps users organize and sort names alphabetically.

The program takes names as input from the user, saves them in a file, and then displays the names in sorted order.

File Name: sorted_names.txt.

Input Format

The input consists of multiple lines, each containing a name represented as a string.

To end the input and proceed with sorting, the user can enter 'q'.

Output Format

The output displays the names in alphabetical order, each name on a new line.

Refer to the sample output for the formatting specifications.

Sample Test Case

Input: Alice Smith
John Doe
Emma Johnson
q

Output: Alice Smith
Emma Johnson
John Doe

Answer

```
names = []
while True:
    name = input()
    if name == 'q':
        break
    names.append(name)

names.sort()

with open("sorted_names.txt", "w") as f:
    for name in names:
        f.write(name + "\n")

for name in names:
    print(name)
```
